

Chart 1 - 11th code block (of 55)

Bar chart of the three reasons, with the number of flights written on each bar

Chart 2 - 13th code block (of 55)

Chart 3 - 22nd code block (of 55)

Problem 5: the delay distribution is lopsided - a few very late flights pull the average up

Distribution of departure delay

Chart 4 - 23rd code block (of 55)

Box plot (Session 5): the box holds the middle 50% of flights, the dots are outliers

Chart 5 - 23rd code block (of 55)

Box plot (Session 5): the box holds the middle 50% of flights, the dots are outliers

Chart 6 - 33rd code block (of 55)

Chart 1: share of flights delayed, by scheduled hour

Chart 7 - 35th code block (of 55)

Chart 2: box plot of delay minutes by time of day (Session 5)

Chart 8 - 36th code block (of 55)

Chart 3: share delayed by carrier

Chart 9 - 37th code block (of 55)

Chart 4: box plot of delay minutes by carrier

Chart 10 - 38th code block (of 55)

Chart 5: Seattle vs Portland, by month

Chart 11 - 39th code block (of 55)

Chart 6: scatter matrix of weather measurements (Session 6)

Chart 12 - 40th code block (of 55)

Chart 7: correlation of each number with departure delay (Session 3)

Chart 13 - 41st code block (of 55)

How precise is our overall number? Take many random samples of 1,000 flights (Session 4)

Chart 14 - 46th code block (of 55)

Box plot of the comparison (Session 5)

Chart 15 - 48th code block (of 55)

Visualize the regression line

Chart 16 - 53rd code block (of 55)

Where is the model wrong? Residual plot (Session 6)

Chart 17 - 54th code block (of 55)

Error for different sizes of delay

Chart 18 - 55th code block (of 55)

Even if minutes are hard to predict, can the model RANK flights by risk?
